CHAPTER 2 SOFTWARE PROCESSES

# SOFTWARE ENGINEERING - FOR ORIENTATION

- Software Engineering is a branch of systems engineering concerned with the development of large and complex software intensive systems. It focuses on:
  - the real-world goals for, services provided by, and constraints on such systems,
  - the precise specification of systems structure and behaviour, and the implementations of these specifications,
  - the activities required in order to develop an assurance that the specifications and real world-world goals have been met,
- the evolution of these systems over time, and across systems families,
- It is also concerned with the processes, methods and tools for the development of software intensive systems in an economic and timely manner.

#### THE SOFTWARE PROCESS

- A structured set of activities required to develop a software system.
- √ Many different software processes but all involve:
  - Specification
  - Design and implementation
  - Validation
  - Evolution.
- ✓ A software process model
  - an abstract representation of a process

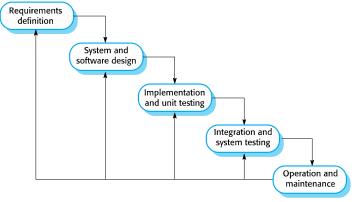

CHAPTER 2. SOFTWARE PROCESSES

#### SOME SOFTWARE PROCESS MODELS

- ✓ The waterfall model
  - Plan-driven model.
  - Separate and distinct phases of specification and development.
- ✓ Incremental development
  - Specification, development and validation are interleaved.
  - May be plan-driven or agile.
- √ Integration and configuration
  - The system is assembled from existing configurable components.
  - May be plan-driven or agile.
- ✓ In practice, most large systems are developed using a process that incorporates elements from all of these models.

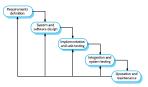

#### THE WATERFALL MODEL

In principle, a phase has to be complete before moving onto the next phase.

CHAPTER 2. SOFTWARE PROCESSES 7

#### WATERFALL MODEL USAGES

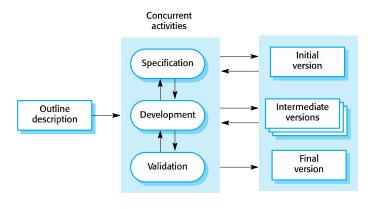

- ✓ The main drawback:
  - the difficulty of accommodating change after the process is underway.
- ✓ Mostly used for large systems engineering projects
  - a system is developed at several sites.
  - the plan-driven nature of the waterfall model helps coordinate the work.
- √ When the requirements are well-understood and changes will be fairly limited during the design process.
  - Few business systems have stable requirements.

#### INCREMENTAL DEVELOPMENT

CHAPTER 2. SOFTWARE PROCESSES

- Reduce the cost of accommodating changing customer requirements
- Easier to get customer feedback on the development work that has been done.
- More rapid delivery and deployment of useful software to the customer

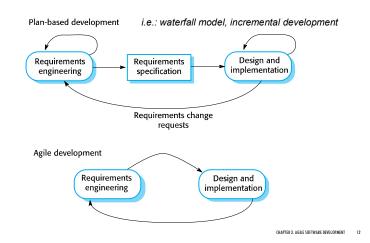

#### INCREMENTAL DEVELOPMENT PROBLEMS

- √ The process is not visible.
  - Managers need regular deliverables
  - Not cost-effective to produce documents for every product version
- System structure tends to degrade as new increments are added.
  - Need time and money on refactoring to improve the software
  - Regular change tends to corrupt the structure.
- Incorporating further software changes becomes increasingly difficult and costly.

#### AGILE DEVELOPMENT

#### AGILE DEVELOPMENT

#### AGILE DEVELOPMENT

PROs	CONs
More flexible	Hard to predict
Product get to market faster	Final product is not released first
Better communication	Documentation gets left behind

#### REUSE-ORIENTED SOFTWARE ENGINEERING

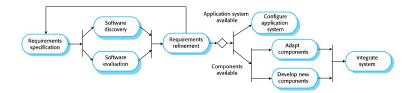

- Based on software reuse where systems are integrated from existing components or application systems (COTS -Commercial-off-the-shelf) systems).
  - Stand-alone application systems (COTS)
  - Package objects / component framework such as .NET or J2EE.
  - Web services
- Reused elements may be configured to adapt their behaviour and functionality to a user's requirements
- Reuse is now the standard approach for building many types of business system

#### REUSE-ORIENTED SOFTWARE ENGINEERING

CHAPTER 2 SOFTWARE PROCESSES

- ✓ Reduced costs and risks as less software is developed from scratch
- √ Faster delivery and deployment of system
- ✓ But requirements compromises are inevitable so system may not meet real needs of users
- √ Loss of control over evolution of reused system elements

CHAPTER 2. SOFTWARE PROCESSES 21

#### **PROCESS ACTIVITIES**

- Real software processes are inter-leaved sequences of technical, collaborative and managerial activities with the overall goal of specifying, designing, implementing and testing a software system.
- The four basic process activities (specified in your book) of specification, development, validation and evolution are organized differently in different development processes.
- In the waterfall model, they are organized in sequence, whereas in incremental development they are inter-leaved.

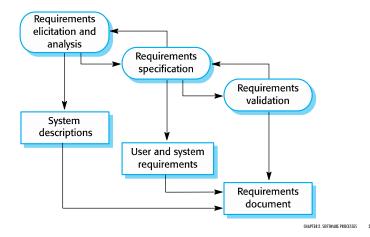

- √ The process of establishing what services are required and the constraints on the system's operation and development.
- √ Feasibility study
- ✓ Use: Requirements engineering process
  - Requirements elicitation and analysis
  - Requirements specification
  - Requirements validation

CHAPTER 2. SOFTWARE PROCESSES 23

#### THE REQUIREMENTS ENGINEERING PROCESS

Aug 20

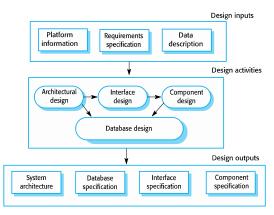

#### ACTIVITY: SOFTWARE DESIGN AND IMPLEMENTATION ~ SOFTWARE DEVELOPMENT

- √ The process of converting the system specification into an executable system.
- ✓ Two (sub) activities:
  - Software design
  - Design a software structure that realises the specification;
  - Implementation
  - Translate this structure into an executable program;
  - The activities of design and implementation are closely related and may be inter-leaved.

CHAPTER 2 SOFTWARE PROCESSES 25

### A GENERAL MODEL OF THE DESIGN PROCESS

#### SYSTEM IMPLEMENTATION

- √ The software is implemented either by developing a program or programs or by configuring an application system.
- ✓ Design and implementation are interleaved activities for most types of software system.
- Programming is an individual activity with no standard process.
- ✓ Debugging is the activity of finding program faults and correcting these faults.

CHAPTER 2 SOFTWARE PROCESSES

#### **ACTIVITY: SOFTWARE VALIDATION**

building the thing right?

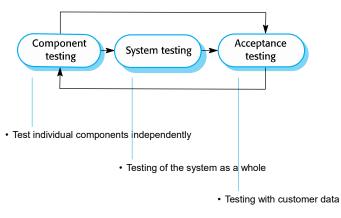

- √ Verification and validation (V & V)
  - to show that a system conforms to its specification and meets the requirements of the system customer.
- ✓ Involves checking and review processes and system testing.
  - System testing: executing the system with test cases
  - Testing: the most commonly used V & V activity.

#### STAGES OF TESTING

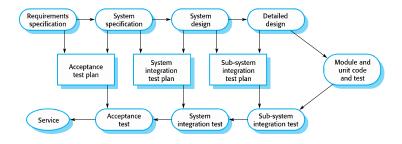

Aug 2019

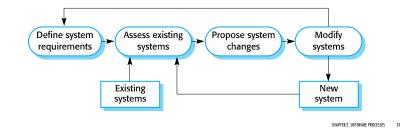

CHAPTER 2. SOFTWARE PROCESSES 29

#### TESTING PHASES IN A PLAN-DRIVEN SOFTWARE PROCESS

#### **ACTIVITY: SOFTWARE EVOLUTION**

- ✓ Software is inherently flexible and can change.
- ✓ Requirements can change
  - (changing business circumstances) => the software must also evolve and change.

COPING WITH CHANGE

**ソンソンソンソン** 

#### **COPING WITH CHANGE**

- √ Change is inevitable in all large software projects.
  - Business changes
  - New technologies
  - Changing platforms
- ✓ Change leads to rework
  - costs include rework (re-analysing requirements) and implementing new functionality

CHAPTER 2. SOFTWARE PROCESSES 33

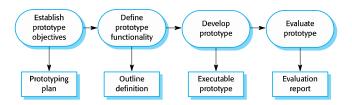

#### SOFTWARE PROTOTYPING

- ✓ A prototype is an initial version of a system used to demonstrate concepts and try out design options.
- ✓ A prototype can be used in:
  - requirements engineering process: requirements elicitation and validation;
  - design processes: options and develop UI design;
  - testing process: run back-to-back tests.

#### **Benefits**

- · Improved system usability.
- · A closer match to users' real needs.
- Improved design quality.
- Improved maintainability.
- Reduced development effort.

#### THE PROCESS OF PROTOTYPE DEVELOPMENT

#### Prototype development:

- May be based on rapid prototyping languages or tools
- May involve leaving out functionality

Aug 201

CHAPTER 2 SOFTWARE PROCESSES 35

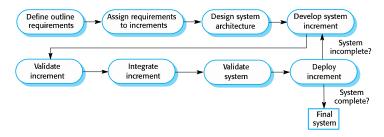

#### INCREMENTAL DELIVERY

- √ The development and delivery is broken down into increments
  - each increment delivering part of the required functionality.
  - user requirements are prioritised and the highest priority requirements are included in early increments.
- √ Two approaches:
  - Incremental development: by developer
  - Incremental delivery: for end-user

Aug 2019

#### INCREMENTAL DELIVERY

#### Advantages:

- system functionality is available earlier. may require a set of basic facilities
- · early increments act as a prototype
- · lower risk of overall project failure.
- · highest priority system services receive most testing.

#### Problems:

- · the specification is developed in conjunction with the software.

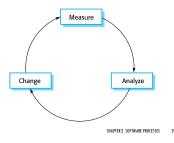

CHAPTER 2 SOFTWARE PROCESSES 37

# PROCESS IMPROVEMENT

#### PROCESS IMPROVEMENT

- √ Software process improvement
  - enhancing the quality of software,
  - reducing costs
  - or accelerating development processes.
- **Process improvement** 
  - understanding existing processes
  - and changing these processes

# PROCESS IMPROVEMENT ACTIVITIES

- Process measurement
  - You measure one or more attributes of the software process or product. These measurements forms a baseline that helps you decide if process improvements have been effective.
- Process analysis
  - The current process is assessed, and process weaknesses and bottlenecks are identified. Process models (sometimes called process maps) that describe the process may be developed.
- Process change
  - Process changes are proposed to address some of the identified process weaknesses. These are introduced and the cycle resumes to collect data about the effectiveness of the changes.

### THE CAPABILITY MATURITY MODEL (CMM)

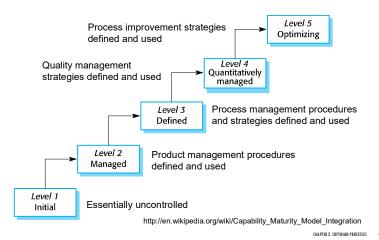

- Capability Maturity Model Integration (CMMI) is a process level improvement training and appraisal program
- CMMI defines the most important elements that are required to build great products, or deliver great service
- √ It is required by many U.S. Government contracts, especially in software development.
